INTERNSHIP DOCUMENTATION

SSN COLLEGE OF ENGINEERING

Company:PATTERNS COGNITIVE

INTERNSHIP DETAILS:

Name:Lokkshanaa.S
Position:Intern
Duration:01-07-2024 to 31-07-2024

Date: 01/07/2024 **Day: Monday**

Task 1: Write a simple calculator python program to perform addition, subtraction, multiplication and division.

Program code:

```
#calculator
n1=int(input("\nEnter the first number:"))
n2=int(input("\nEnter the second number:"))
op=int(input("\nEnter the operation to be done: \n1.Add \n2.Subtract \n3.Multiply \n4.Division \n"))
if(op==1):
    print("Addition operation is done")
    result=n1+n2
elif(op==2):
    print("Subtraction operation is done")
    result=n1-n2
elif(op==3):
    print("Multiplication operation is done")
    result=n1*n2
elif(op==4):
    print("Division operation is done")
    result=n1/n2
else:
    print("Invalid input given ")
print("Result is",result)
```

Input and output:

Case 1: Addition

```
Enter the first number:3468

Enter the second number:892

Enter the operation to be done:
1.Add
2.Subtract
3.Multiply
4.Division
1
Addition operation is done
Result is 4360
```

Case 2: Subtraction

```
Enter the first number:89754

Enter the second number:7354

Enter the operation to be done:
1.Add
2.Subtract
3.Multiply
4.Division
2
Subtraction operation is done
Result is 82400
```

Case 3: Multiplication

```
Enter the first number:8794

Enter the second number:123

Enter the operation to be done:
1.Add
2.Subtract
3.Multiply
4.Division
3
Multiplication operation is done
Result is 1081662
```

Case 4: Division

```
Enter the first number:1083

Enter the second number:18

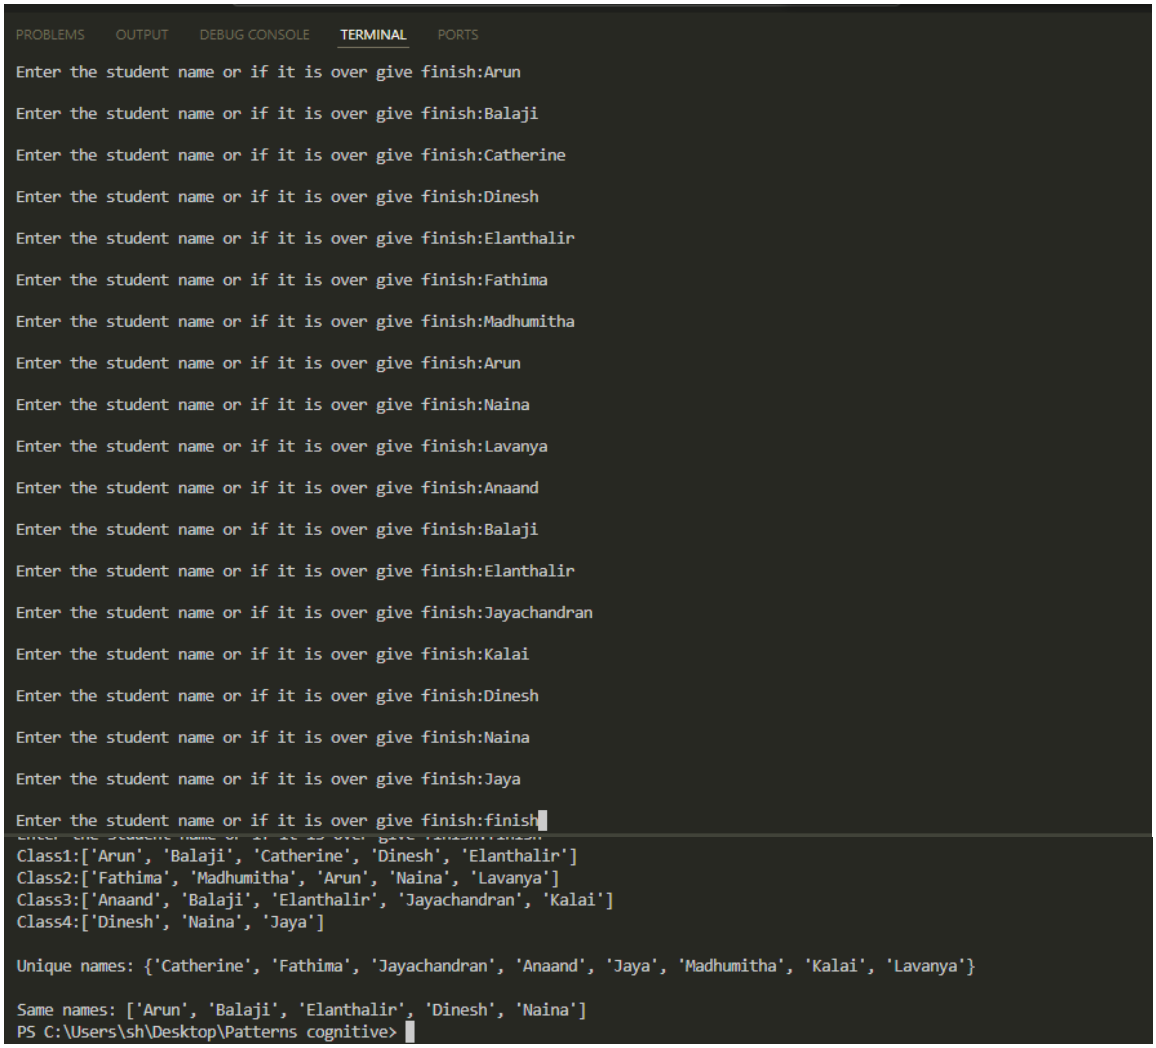
Enter the operation to be done:
1.Add
2.Subtract
3.Multiply
4.Division
4
Division operation is done
Result is 60.166666666666664
```

Task 2: Write a Python program to create classes of students where each class contains a maximum of 5 students. Continuously accept student names as input until "finish" is entered. If a student's name appears more than once, it should be added to a list of repeated names and excluded from further classes. Display the grouped classes, unique student names, and repeated names.

Program code:

```python
stud_list=[]
current=[]
same_name=[]
unique_name=set()
while True:
    stud_name=input("\nEnter the student name or if it is over give finish:")
    if stud_name=="finish":
        break
    if stud_name in same_name:
        continue
    else:
        if stud_name in unique_name:
            unique_name.remove(stud_name)
            same_name.append(stud_name)
        else:
            unique_name.add(stud_name)
    current.append(stud_name)
    if len(current)==5:
        stud_list.append(current)
        current=[]
if current:
    stud_list.append(current)
for i,stud_list in enumerate(stud_list):
    print(f"Class{i+1}:{stud_list}")
print("\nUnique names:", unique_name)
print("\nSame names:", same_name)
```

Input and output:



Date: 02/07/2024 **Day: Tuesday**

Task : Write a Python program to collect and display student details. The program should prompt the user to enter basic information, including the student's name, register number, date of birth, gender, and marks for five subjects. It should then calculate the total marks, percentage, and determine if the student has passed or failed, displaying all the information in a formatted result.

Program code:

```python
# Collect student details
def details():
    s_name = input("Enter the student name: ")
    s_regno = input("Enter the student register number: ")
    stud_dob = input("Enter the date of birth (DD-MM-YYYY): ")

    lang1_mark = int(input("Enter the language 1 mark: "))
    lang2_mark = int(input("Enter the language 2 mark: "))
    maths_mark = int(input("Enter the maths mark: "))
    sci_mark = int(input("Enter the science mark: "))
    socsci_mark = int(input("Enter the social science mark: "))

    gender = input("Enter the gender (Male/Female): ")

    # Calculate total and percentage
    stud_total = lang1_mark + lang2_mark + maths_mark + sci_mark + socsci_mark
    stud_percent = (stud_total / 500) * 100

    # Determine pass or fail
    if lang1_mark < 35 or lang2_mark < 35 or maths_mark < 35 or sci_mark < 35 or socsci_mark < 35:
        final_result = "Fail"
    else:
        final_result = "Pass"

    # Display student details
    print("\nSSLC EXAMINATION RESULTS")
    print("STUDENT DETAILS:")
    print(f"Student Name:    {s_name}")
    print(f"Register Number: {s_regno}")
    print(f"Date of birth:   {stud_dob}")
    print(f"Language 1:      {lang1_mark}")
    print(f"Language 2:      {lang2_mark}")
    print(f"Maths:           {maths_mark}")
    print(f"Science:         {sci_mark}")
    print(f"Social Science:  {socsci_mark}")
    print(f"Total:           {stud_total}")
    print(f"Percentage:      {stud_percent:.2f}%")
    print(f"Final result:    {final_result}\n")

# Starting of the program
def start():
    while True:
        y = input("Do you want to enter student details? (yes/no): ")
        if y.lower() == "yes":
            details()
        else:
            break

print("STUDENT DETAILS:")
start()
```

Input and output:

```
STUDENT DETAILS:
Do you want to enter student details? (yes/no): yes
Enter the student name: Anand
Enter the student register number: 70332
Enter the date of birth (DD-MM-YYYY): 09-09-2003
Enter the language 1 mark: 87
Enter the language 2 mark: 76
Enter the maths mark: 65
Enter the science mark: 54
Enter the social science mark: 87
Enter the gender (Male/Female): Male

```

In order to avoid the numbers and special characters in the respective input, adding validations to avoid inappropriate input.

Date: 03/07/2024 ,04/07/2024 and 05/07/2024

Day: Wednesday , Thursday and Friday

Task: Learn about string functions and regular expressions in Python and modify the given Python program to include input validations. Develop a Python program to capture and validate student details, including name, register number, date of birth, gender, and marks for various subjects. The program should ensure the validity of each input, calculate the total and percentage of marks, and determine the final result (pass/fail) based on individual subject marks. The program should display the student's examination results and prompt the user to enter details for multiple students until the user decides to stop.

Program code:

```python
from datetime import datetime
import re
def details():

    #student name
    def name():
        stud_name=input("Enter the name again:")
        return stud_name
    s_name=input("Enter the student name:")
    while not re.match(r'^[a-zA-Z\s]+$', s_name):
            if not s_name.isalnum():
                print("You have entered some special characters. please provide name in alphabets")
                s_name=name()
            else:
                if not s_name.replace(' ', '').isalpha():
                    print("You have entered numbers.please provide name in alphabet")
                s_name=name()
    #print("The student name is",s_name)

    #student register no
    def regno():
        stud_regno=input("Enter the register no(only 6 digits):")
        return stud_regno
    s_regno=input("Enter the student register no:")
    while not s_regno.isdigit():
        if s_regno.isalpha():
            print("You have entered alphabets.Enter digits" )
            s_regno=regno()

Task : Learn about exception handling in Python using the try and except methods. Modify the given Python program to include input validations using only try and except blocks. The program should prompt the user to enter student details, including the student's name, register number, date of birth, gender, and marks for five subjects. It should validate the inputs to ensure they meet specified criteria, handle any invalid inputs or errors using try and except, and then calculate the total marks, percentage, and determine if the student has passed or failed. Display all the information in a formatted result.

Program code:

```
import re
def details():

    def name():
        while True:
            try:
                s_name = input("Enter the student name: ")
                if not re.match(r'^[a-zA-Z\s]+$', s_name):
                    if not s_name.isalnum():
                        raise ValueError("You have entered some special characters. Please provide the
name in alphabets.")
                    elif not s_name.replace(' ', '').isalpha():
                        raise ValueError("You have entered numbers. Please provide the name in
alphabets.")
                return s_name
            except ValueError as ve:
                print(ve)
                #s_name = name()

Date: 09/07/2024 **Day:Tuesday**

Task: Develop a Python program to capture and validate student details, including name, register number, date of birth, gender, and marks in various subjects. The program should ensure the inputs are correctly formatted and within acceptable ranges, compute the total and percentage marks, determine the final result (pass or fail), and log all details, including errors, in a log file using the logging module. The program should repeatedly prompt the user to enter details for multiple students until the user chooses to stop.

Program code:

```
import re
import logging

logging.basicConfig(level=logging.INFO ,filename="student_details",filemode="a",
                        format=("%(asctime)s - %(levelname)s - %(message)s"))

def details():

    def name():
        while True:
            try:
                s_name = input("Enter the student name: ")
                if not re.match(r'^[a-zA-Z\s]+$', s_name):
                    if not s_name.isalnum():
                        raise ValueError("You have entered some special characters. Please provide the
name in alphabets.")
                    elif not s_name.replace(' ', '').isalpha():
                        raise ValueError("You have entered numbers. Please provide the name in
alphabets.")
                return s_name
            except ValueError as ve:
                print(ve)
                logging.error("Invalid input")

Date:12/07/2024 and 15/07/2024
Day:Friday and Monday

Task: Create a Python program to manage student records, including entering new details and searching for existing records stored in an Excel file. The program should validate inputs for student information such as name, register number, date of birth, gender, and marks in five subjects. It should calculate the total marks, percentage, and determine the final result (pass or fail), assigning grades based on the marks. The records should be saved to an Excel file with bolded column headers, and the final result should be highlighted if it is "Fail". The program should also

provide an option to display and print student details, formatted in a tabular format and also to search for student details in an Excel file using their register number and date of birth. The program should display the student's information if found, including name, gender, and marks in five subjects, and calculate the total marks and percentage. It should also save these details in a text file named with the student's register number, open it in Notepad on a Windows system

Program code:

```
from datetime import datetime
import re
import os
from openpyxl import Workbook, load_workbook
from openpyxl.styles import Font,PatternFill
from tabulate import tabulate

def details():
    # Function to get and validate student name
    #student name

Date: 16/07/2024 **Day:Tuesday**

Task: Develop a Python program that extracts text from an image using Tesseract OCR and saves it to a text file. The program should then provide functionality to count words, lines, each character's occurrence, special characters, and specific words ("for", "the", "of", "it") in the text file. Users should be able to interactively choose and perform these operations, with the results displayed accordingly.

Program code:

```
import pytesseract
from PIL import Image
import os

pytesseract.pytesseract.tesseract_cmd = r'C:\Users\sh\Desktop\Pattens cognitive\Tesseract
python\tesseract.exe'

img_file="computer.jpg"

#method to count the number of words in the text file
def count_words(file):
    try:
        with open(file,"r") as f:
            content=f.read()
            word_count=len(content.split())
            print(f"No of words: {word_count}")
    except Exception as e:
        print(f"An error occured : {e}")

#method to count the number of lines in the text file
def count_lines(file):
    try:

Task: Create a database with at least two related tables. Populate the tables with sample data. Practice SQL queries such as selecting specific columns, filtering records, joining tables, updating records, and deleting records based on certain conditions.

SQL QUERIES:

Create SQL query

```sql
CREATE DATABASE SchoolDB;
USE SchoolDB;

CREATE TABLE Students (
    StudentID INT PRIMARY KEY,
    FirstName VARCHAR(50),
    LastName VARCHAR(50),
    BirthDate varchar(10)
);

CREATE TABLE Courses (
    CourseID INT PRIMARY KEY,
    CourseName VARCHAR(100)
);

CREATE TABLE Enrollments (
    EnrollmentID INT PRIMARY KEY,
    StudentID INT,
    CourseID INT
);
```

Insert details into tables:

```sql
INSERT INTO Students (StudentID, FirstName, LastName, BirthDate) VALUES (1, 'Arun', 'Sundar', '09-09-2003');
INSERT INTO Students (StudentID, FirstName, LastName, BirthDate) VALUES (2, 'Meena', 'Raj', '12-05-2002');
INSERT INTO Students (StudentID, FirstName, LastName, BirthDate) VALUES (3, 'Ravi', 'Kumar', '03-11-2001');
INSERT INTO Students (StudentID, FirstName, LastName, BirthDate) VALUES (4, 'Anita', 'Sharma', '21-02-2003');
INSERT INTO Students (StudentID, FirstName, LastName, BirthDate) VALUES (5, 'Vijay', 'Patel', '15-08-2000');

INSERT INTO Courses (CourseID, CourseName) VALUES (1, 'Mathematics');
INSERT INTO Courses (CourseID, CourseName) VALUES (2, 'Physics');
INSERT INTO Courses (CourseID, CourseName) VALUES (3, 'Chemistry');
INSERT INTO Courses (CourseID, CourseName) VALUES (4, 'Biology');
INSERT INTO Courses (CourseID, CourseName) VALUES (5, 'English');

INSERT INTO Enrollments (EnrollmentID, StudentID, CourseID) VALUES (1, 1, 1);
INSERT INTO Enrollments (EnrollmentID, StudentID, CourseID) VALUES (3, 3, 2);
INSERT INTO Enrollments (EnrollmentID, StudentID, CourseID) VALUES (4, 4, 3);
INSERT INTO Enrollments (EnrollmentID, StudentID, CourseID) VALUES (5, 5, 4);
INSERT INTO Enrollments (EnrollmentID, StudentID, CourseID) VALUES (6, 1, 2);
```

Select query using where condition:

```sql
-- Select all students born after 01-01-2002
SELECT * FROM Students WHERE BirthDate> '01-01-2002';
-- Select all enrollments for a specific student
SELECT * FROM Enrollments WHERE StudentID = 1;
```

Result Grid | Filter Rows: | Edit: | Export/Import: | Wrap Cell Content:

StudentID	FirstName	LastName	BirthDate
1	Arun	Sundar	09-09-2003
2	Meena	Raj	12-05-2002
3	Ravi	Kumar	03-11-2001
4	Anita	Sharma	21-02-2003
5	Vijay	Patel	15-08-2000
NULL	NULL	NULL	NULL

Result Grid | Filter Rows: | Edit: | Export/Import: | Wrap Cell Content:

EnrollmentID	StudentID	CourseID
1	1	1
6	1	2
NULL	NULL	NULL

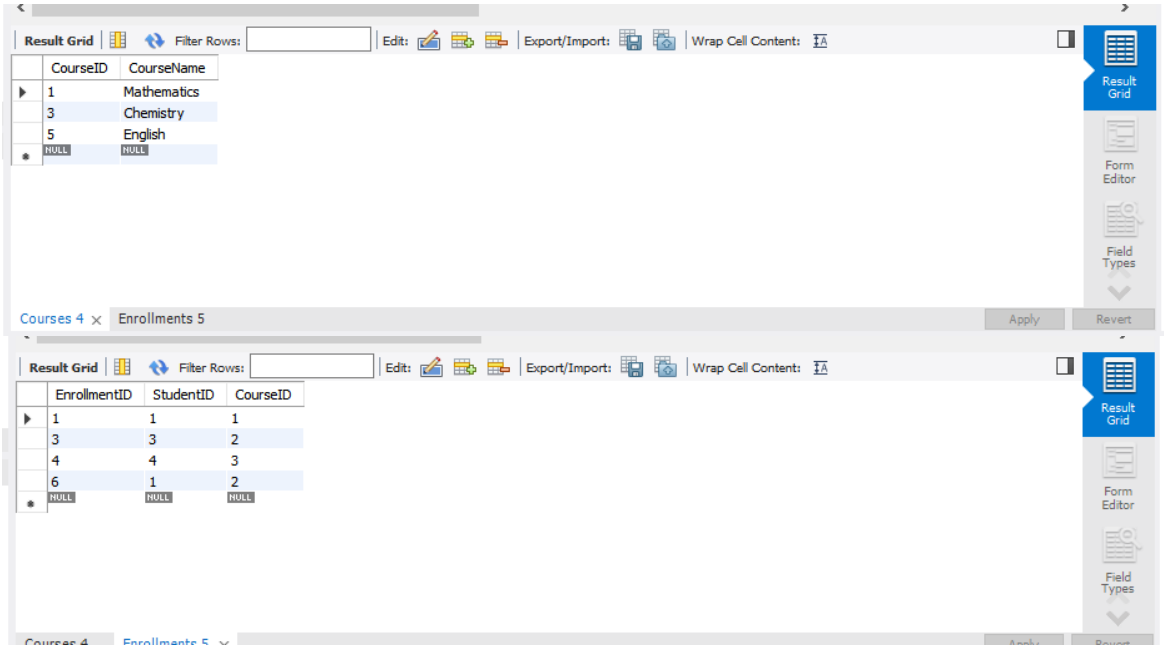
Result Grid, Form Editor, Field Types

Students 2 | Enrollments 3 | Apply | Revert

Select query using in clause:

```sql
-- Select all courses with CourseID in a specific list
SELECT * FROM Courses
WHERE CourseID IN (1, 3, 5);

-- Select all students enrolled in specific courses
SELECT * FROM Enrollments
WHERE CourseID IN (1, 2, 3);
```

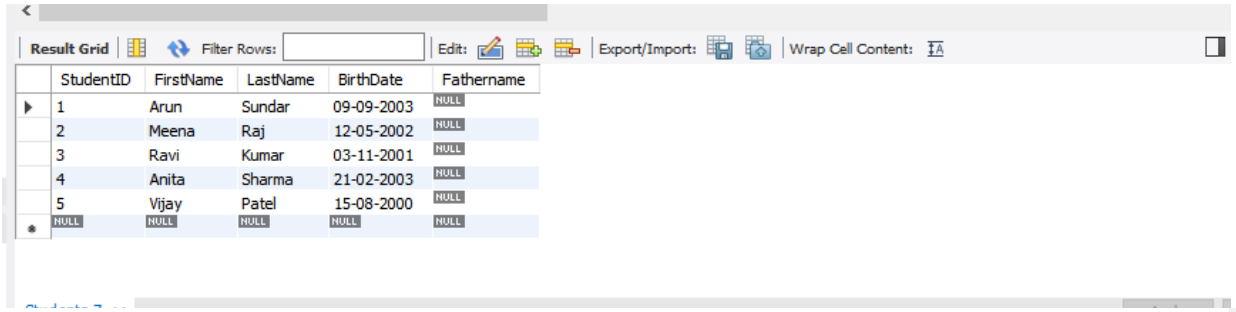


CourseID	CourseName
1	Mathematics
3	Chemistry
5	English

EnrollmentID	StudentID	CourseID
1	1	1
3	3	2
4	4	3
6	1	2

Alter query to modify the table:

```
53  ALTER TABLE Students ADD Fathername VARCHAR(100);
54  select * from Students;
```

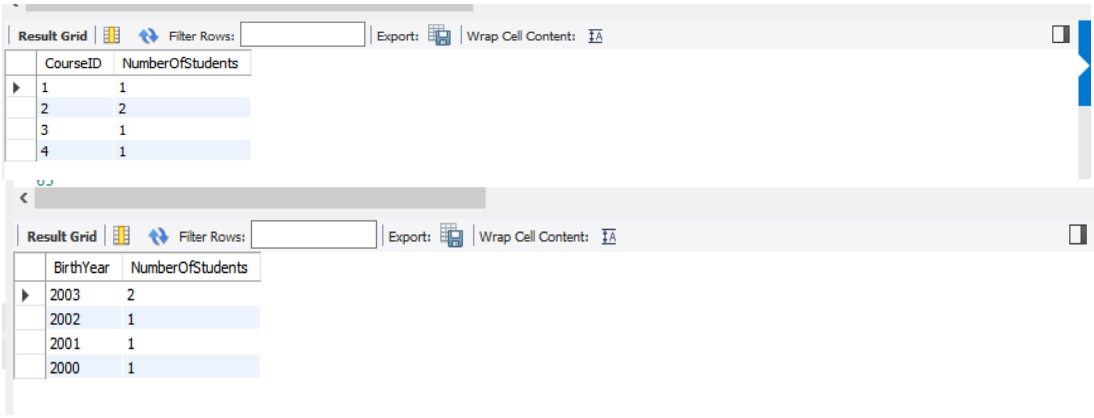


StudentID	FirstName	LastName	BirthDate	Fathername
1	Arun	Sundar	09-09-2003	NULL
2	Meena	Raj	12-05-2002	NULL
3	Ravi	Kumar	03-11-2001	NULL
4	Anita	Sharma	21-02-2003	NULL
5	Vijay	Patel	15-08-2000	NULL

```
55  ALTER TABLE Students MODIFY BirthDate DATE;
56  ALTER TABLE Students DROP COLUMN Fathername;
```

Group by clause:

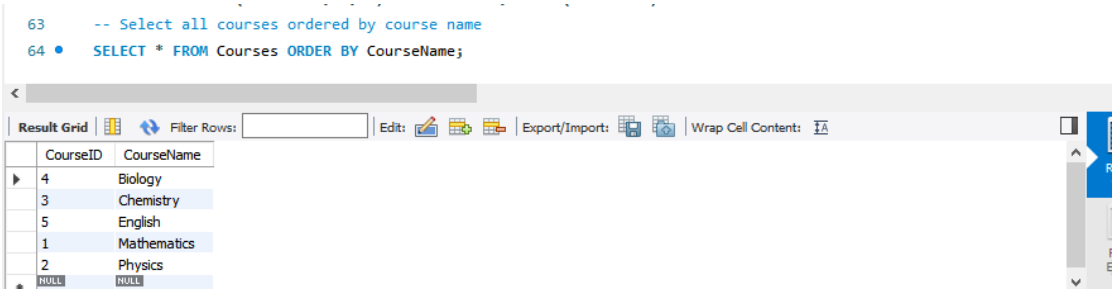
```
57
58      -- Count the number of students enrolled in each course
59  SELECT CourseID, COUNT(StudentID) AS NumberOfStudents FROM Enrollments GROUP BY CourseID;
60
61      -- Group students by birth year
62  SELECT SUBSTRING(BirthDate, 7, 4) AS BirthYear, COUNT(StudentID) AS NumberOfStudents FROM Students GROUP BY BirthYear;
63
```



CourseID	NumberOfStudents
1	1
2	2
3	1
4	1

BirthYear	NumberOfStudents
2003	2
2002	1
2001	1
2000	1

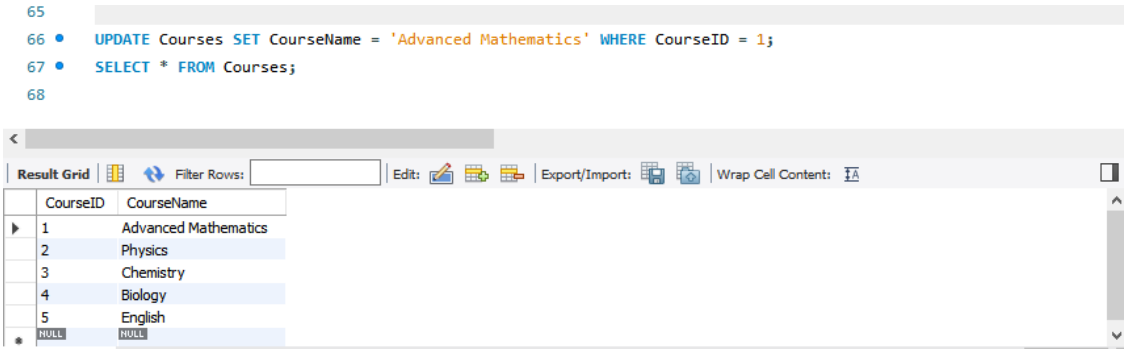
Order by:



```
-- Select all courses ordered by course name
SELECT * FROM Courses ORDER BY CourseName;
```

CourseID	CourseName
4	Biology
3	Chemistry
5	English
1	Mathematics
2	Physics

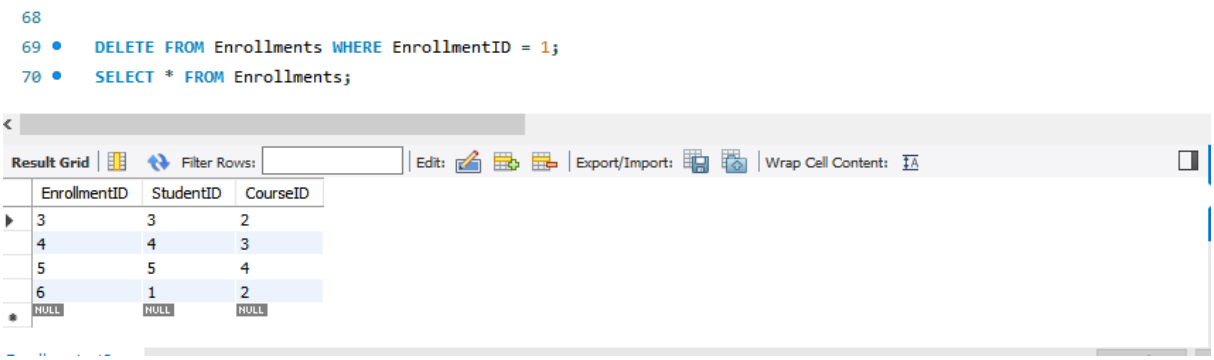
Update query:



```
UPDATE Courses SET CourseName = 'Advanced Mathematics' WHERE CourseID = 1;
SELECT * FROM Courses;
```

CourseID	CourseName
1	Advanced Mathematics
2	Physics
3	Chemistry
4	Biology
5	English

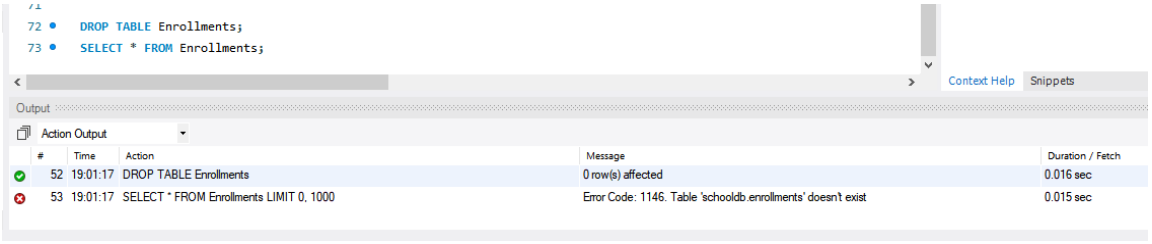
Delete query:



```
DELETE FROM Enrollments WHERE EnrollmentID = 1;
SELECT * FROM Enrollments;
```

EnrollmentID	StudentID	CourseID
3	3	2
4	4	3
5	5	4
6	1	2

Drop query:



Transaction Control Language (TCL):

1.) Begin Transaction:
START TRANSACTION;

2.)Commit Transaction:
COMMIT;

3.)Rollback Transaction:
ROLLBACK;

4.)Savepoint and Rollback to Savepoint:
SAVEPOINT sp1;
UPDATE Students SET Email = 'new.email@example.com' WHERE StudentID = 1; ROLLBACK TO sp1;

Data Control Language (DCL):

1.) Grant Privileges:
GRANT SELECT, INSERT ON Students TO 'root'@'localhost';

2.)Revoke Privileges:
REVOKE INSERT ON Students FROM 'root'@'localhost';

```

Date:22/07/2024 **Day:Monday**

Task: Create a Python program that manages student records by capturing and validating student details, saving them to an Excel file, and providing a search functionality to retrieve and display student details. The program should handle inputs for student name, register number, date of birth, gender, and marks for various subjects. It should calculate grades, total marks, and the final result (pass/fail). Additionally, the program should enable printing of student details to a text file if a matching record is found.

Program code:

```
from datetime import datetime
import re
import os
from openpyxl import Workbook, load_workbook
from openpyxl.styles import Font, PatternFill

def details():
    # Function to get and validate student name
    try:
        s_name = input("Enter the student name:")
        while not re.match(r'^[a-zA-Z\s]+$', s_name):
            if not s_name.isalnum():
                print("You have entered some special characters. Please provide name in alphabets.")
            else:
                print("You have entered numbers. Please provide name in alphabets.")
            s_name = input("Enter the student name:")
    except Exception as e:
        print(f"An error occurred: {e}")

    # Student register no
    try:
        s_regno = input("\nEnter your register number:")
        while not s_regno.isdigit() or len(s_regno) != 6:
            if s_regno.isalpha():
                print("You have entered alphabets. Please enter only digits.")
            elif s_regno.isalnum():
                print("You have entered a combination of letters and digits. Please enter only
digits.")
            else:
                print("You have entered special characters. Please enter only digits.")
            s_regno = input("\nEnter your register number:")
    except Exception as e:
        print(f"An error occurred: {e}")

    # Student date of birth
    try:
        while True:
            stud_dob = input("Enter the date of birth (DD-MM-YYYY):")
            format_of_dob = r'^\d{2}-\d{2}-\d{4}$'
            if re.match(format_of_dob, stud_dob):
                break

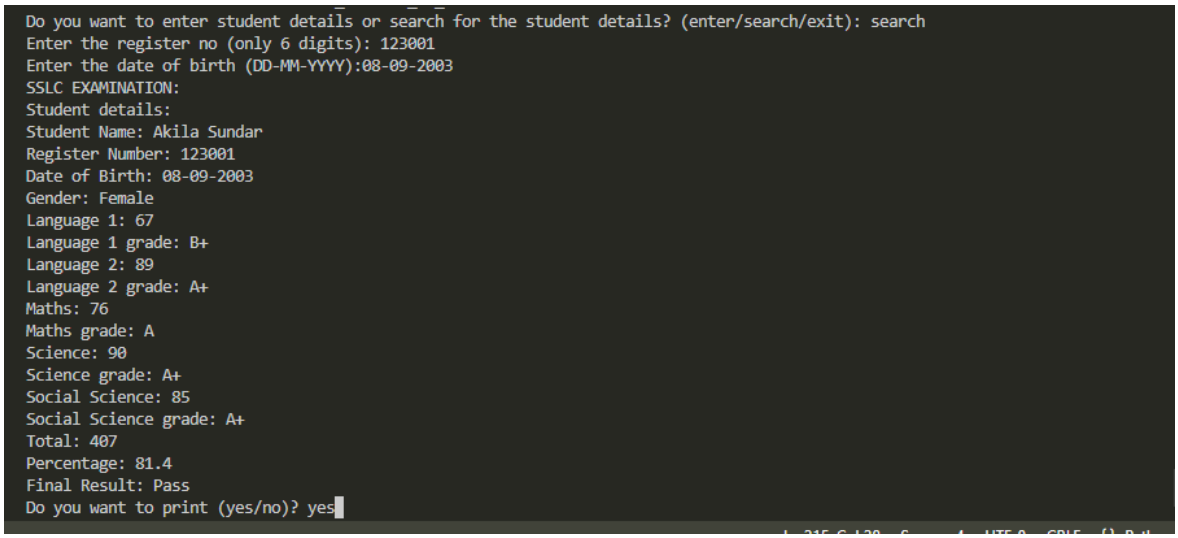
Input and output:

Entering the student details:

	A	B
1	Student Name	Priya
2	Register Number	123456
3	Date of Birth	09-09-2003
4	Gender	Female
5	Language 1	67
6	Language 1 grade	B+
7	Language 2	89
8	Language 2 grade	A+
9	Maths	74
10	Maths grade	A
11	Science	90
12	Science grade	A+
13	Social Science	65
14	Social Science grade	B+
15	Total	385
16	Percentage	77
17	Final Result	Pass

Searching for a student record:



Date:23/07/2024 and 24/07/2024
Day:Tuesday and Wednesday

Task: Design a Python program to manage student records in a MySQL database. The program should:

1.) Allow users to create a new database and tables with customizable column names.
2.) Insert, update, search, delete, and display student records with validations for various input fields such as name, register number, date of birth, and marks.
3.) Include functionality to alter tables by adding or deleting columns.

Program code:

```
import mysql.connector
import re

#connection to mysql
def connect_to_mysql():
    return mysql.connector.connect(
        host="localhost",
        user="root",
        password="Sairam2003!123"
    )

#creating the database
def create_database(cursor):
    try:
        db_name = input("Enter the database name to be created: ")
        cursor.execute(f"SHOW DATABASES LIKE '{db_name}'")
        result = cursor.fetchone()
        if result:
            print(f"Database '{db_name}' already exists.")
        else:
            cursor.execute(f"CREATE DATABASE `{db_name}`")
            print(f"Database '{db_name}' created successfully.")
        return db_name
    except Exception as e:
        print(f"An error occurred: {e}")

#creating the tabele and passing the cursor as the parameter
def create_table(cursor):
    try:
        while True:
            table_name = input("Enter the table name to be created (or type 'exit' to stop): ")

Date:25/07/2024 **Day: Thursday**

Task: Develop a Python script to manage JSON file operations. The script should allow users to read and print specific fields from a JSON file, handling errors like file not found. Additionally, it should offer an option to write data to the JSON file.

Program code:

```python
import json
import os

#to know the current directory that is working
print(f"Current working directory: {os.getcwd()}")

def read_data():
    try:
        file_name=input("Enter the file name:")
        with open (file_name,"r") as file:

            #loading the contents of the file into data
            data=json.load(file)

            #to read the json file and print the contents of the file
            print(data)

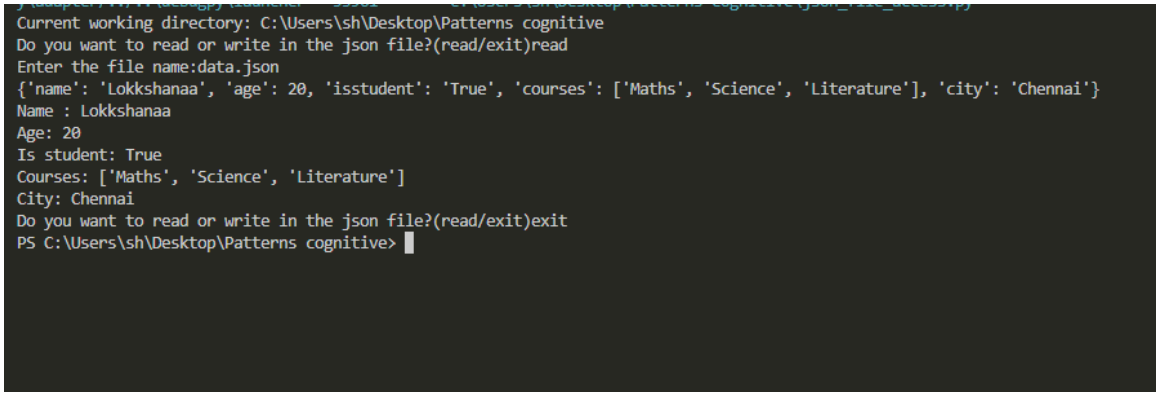
            #accessing each elements of the json file
            print(f"Name : {data["name"]}")
            print(f"Age: {data["age"]}")
            print(f"Is student: {data["isstudent"]}")
            print(f"Courses: {data["courses"]}")
            print(f"City: {data["city"]}")

    except FileNotFoundError:
        print(f"An error occured ")

def main():
    while True:
        action=input("Do you want to read or write in the json file?(read/write/exit)")
        if action.lower()=="read":
            read_data()
        elif action.lower()=="write":
            write_data()

main()
```

Input and output:



```python
#connection to mysql
try:
    with open ("mysql_details.json","r") as json_file:
        data=json.load(json_file)
        mydb=mysql.connector.connect(
            host=data["host"],
            username=data["username"],
            password=data["password"],
            database=data["database"]
    )
except mysql.connector.Error as e:
    print(f"An error occured {e}")
```

The MYSQL data can be fetched from the json file “mysql_details”

Patterns cognitive > {} mysql_details.json > ...

```json
{
"host":"localhost",
"username":"root",
"password":"Sairam2003!123",
"database":"ABC_SCHOOL"
}
```

Date:26/07/2024 **Day: Friday**

Task: Create a Python script using the cv2 module to perform various image processing operations, including converting an image to grayscale, rotating it to the right or left, and resizing it based on user input. The script should handle errors gracefully and display the original and processed images. Implement a user-driven menu to select the desired operation and ensure proper handling of image loading and manipulation.

Program code:

```python
#using cv2 module
import cv2

def gray_scale(img):
    try:
        if img is None:
            print("Image couldn't be loaded")
        else:
            #grayscaling an image
            gray_img=cv2.cvtColor(img,cv2.COLOR_BGR2GRAY)
            cv2.imshow("Gray_img",gray_img)
            cv2.waitKey(0)
            cv2.destroyAllWindows()
    except Exception as e:
        print(f"An error occured {e}")

def rotate_right(img):
    try:
        if img is None:
            print("Image couldn't be loaded")
        else:
            #rotate right
            right_rot_imag=cv2.rotate(img,cv2.ROTATE_90_CLOCKWISE)
            cv2.imshow("image rotated right",right_rot_imag)
            cv2.waitKey(0)
            cv2.destroyAllWindows()
    except Exception as e:
        print(f"An error occured {e}")
```

```
def rotate_left(img):
    try:
        if img is None:
            print("Image couldn't be loaded")
        else:
            #rotate left
            left_rot_imag=cv2.rotate(img,cv2.ROTATE_90_COUNTERCLOCKWISE)
            cv2.imshow("image rotated left",left_rot_imag)
            cv2.waitKey(0)
            cv2.destroyAllWindows()
    except Exception as e:
        print(f"An error occured {e}")

def resize(img):
    try:
        if img is None:
            print("Image couldn't be loaded")
        else:
            w=int(input("Enter the width:"))
            h=int(input("Enter the height:"))
            resize_imag=cv2.resize(img,(w,h))
            cv2.imshow("resized image",resize_imag)
            cv2.waitKey(0)
            cv2.destroyAllWindows()
    except Exception as e:
        print(f"An error occured {e}")

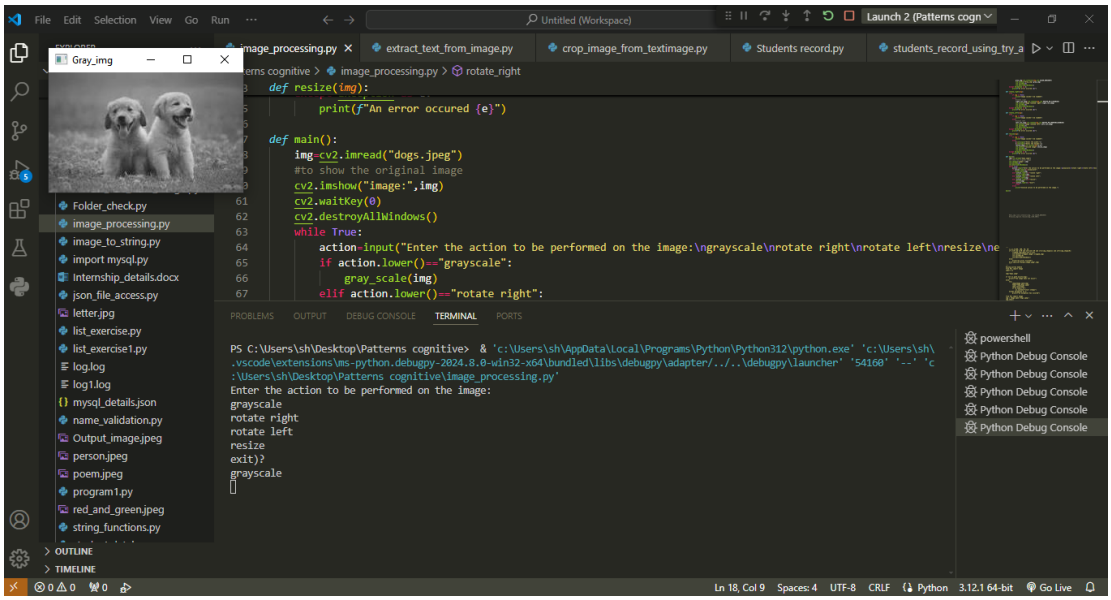
def main():
    img=cv2.imread("dogs.jpeg")
    #to show the original image
    cv2.imshow("image:",img)
    cv2.waitKey(0)
    cv2.destroyAllWindows()
    while True:
        action=input("Enter the action to be performed on the image:\ngrayscale\nrotate right\nrotate
left\nresize\nexit)?\n")
        if action.lower()=="grayscale":
            gray_scale(img)
        elif action.lower()=="rotate right":
            rotate_right(img)
        elif action.lower()=="rotate left":
            rotate_left(img)
        elif action.lower()=="resize":
            resize(img)
        elif action.lower()=="exit":
            break
        else:
            print("Invalid action to be performed on the image.")

main()
```

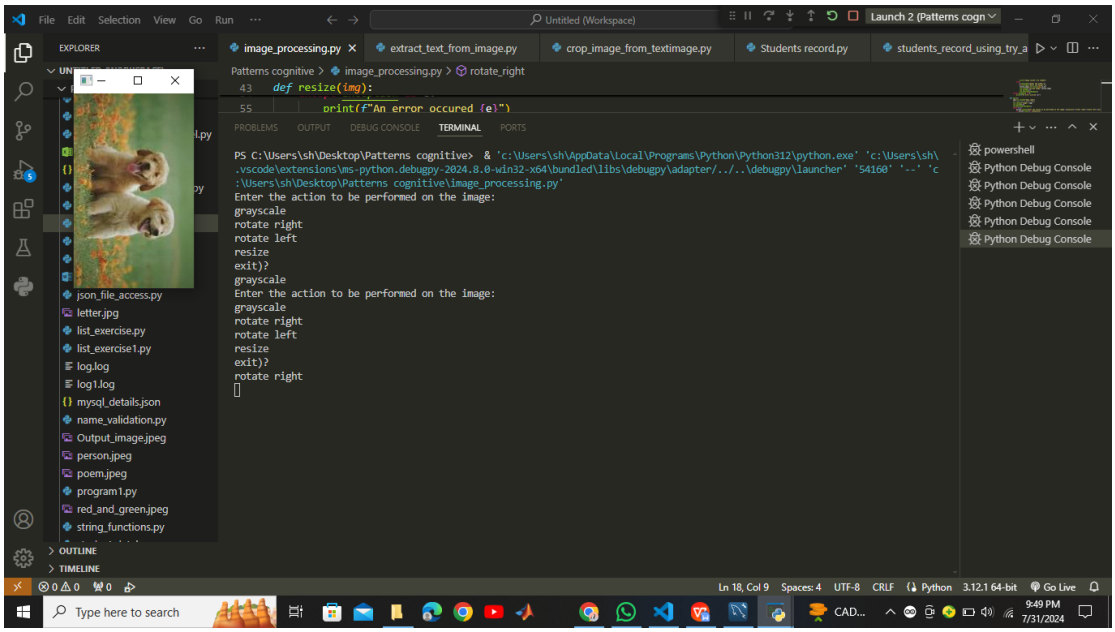
Input and output:

Displaying the original image

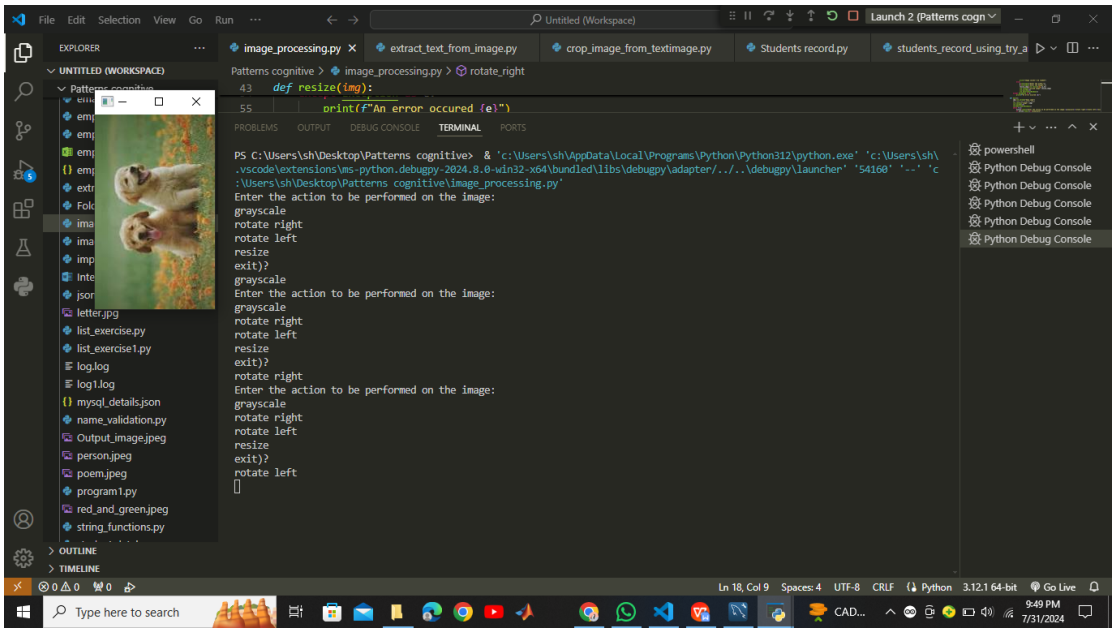
Grayscaling an image:



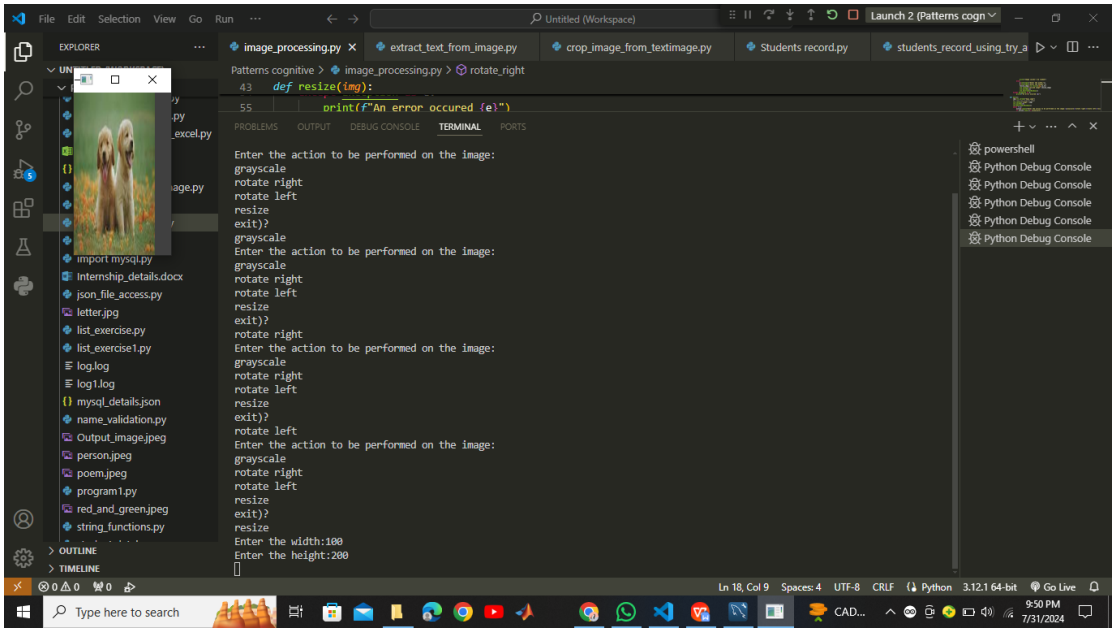
Rotating right the image:



Rotating left the image:



Resizing an image:



Task: Develop a Python program using the cv2 module to perform various image processing operations on an input image. The operations should include displaying a blurred version of the image, applying different thresholding techniques, calculating and displaying intensity statistics, generating and plotting a grayscale histogram, adding two images, and cropping a specified region of the image. Ensure each operation is correctly implemented and handles potential errors gracefully.

Program code:

```
import cv2
import numpy as np
from matplotlib import pyplot as pt

image_file="dogs.jpeg"
#imag=cv2.imread(image_file)

def show_image(image_file):
    img=cv2.imread(image_file)
    cv2.imshow("image",img)
    cv2.waitKey(0)
    cv2.destroyAllWindows()
    blurred_img = cv2.GaussianBlur(img, (5, 5), 0)
    cv2.imshow("Blurred Image", blurred_img)
    cv2.waitKey(0)
    cv2.destroyAllWindows()

def threshing_image(image_file):

    img=cv2.imread(image_file,cv2.IMREAD_GRAYSCALE)
    ret,thresh_image=cv2.threshold(img,127,255,cv2.THRESH_BINARY)
    cv2.imshow("Threshed image",thresh_image)
    cv2.waitKey(0)
    cv2.destroyAllWindows()

    ret,thresh_image_inv=cv2.threshold(img,127,255,cv2.THRESH_BINARY_INV)
    cv2.imshow("Threshed image",thresh_image_inv)
    cv2.waitKey(0)
    cv2.destroyAllWindows()

    ret,thresh_image_trunc=cv2.threshold(img,127,255,cv2.THRESH_TRUNC)

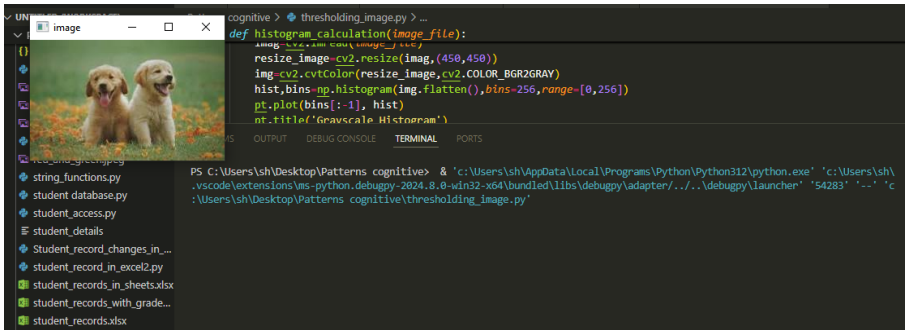
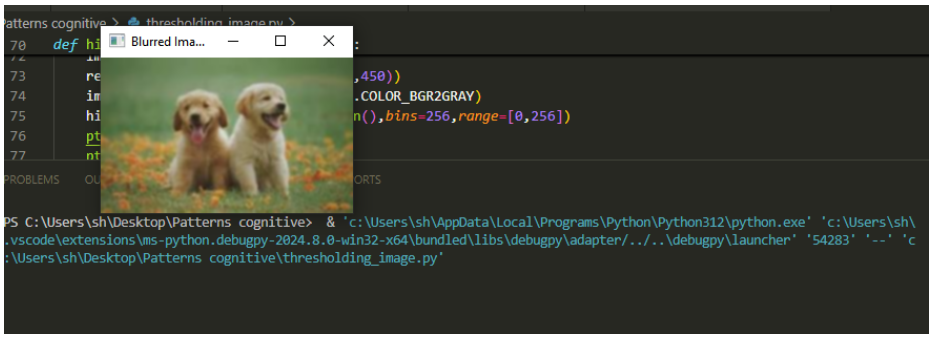
add_images()
crop_image()
```

Input and output:

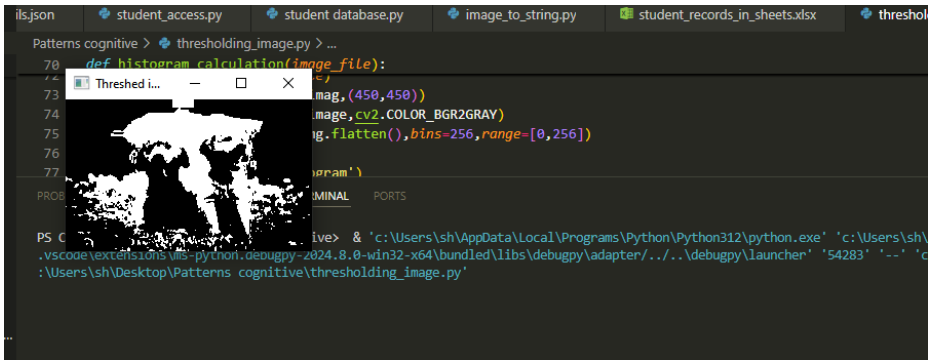
Displaying an original image



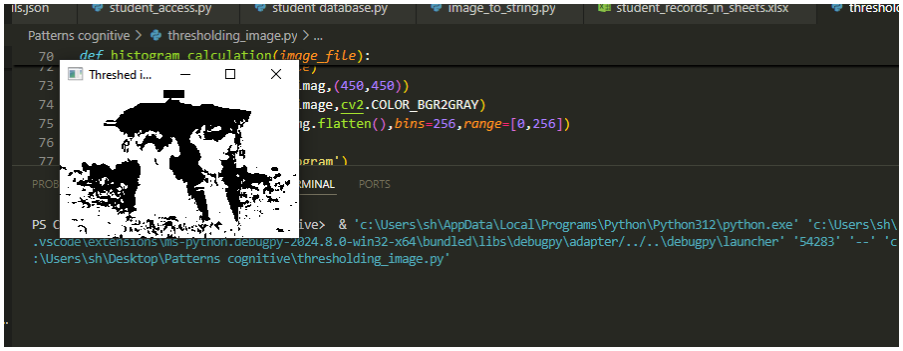
Blurring the image



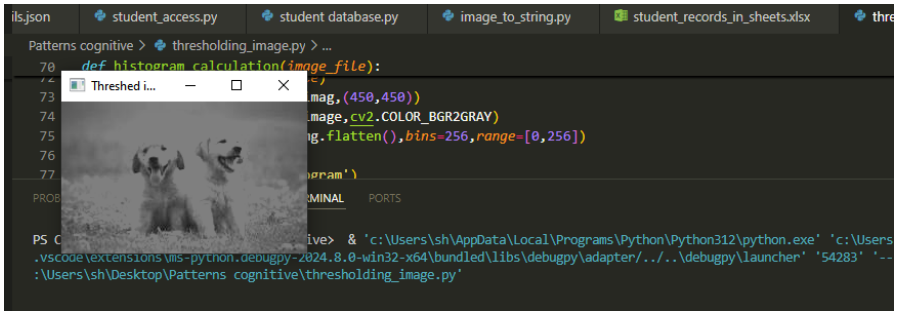
Thresholding an image using THRESH_BINARY



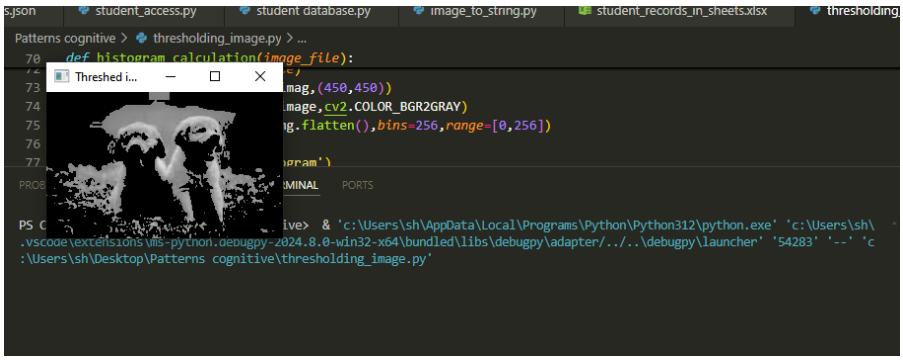
Thresholding an image using THRESH_BINARY_INV



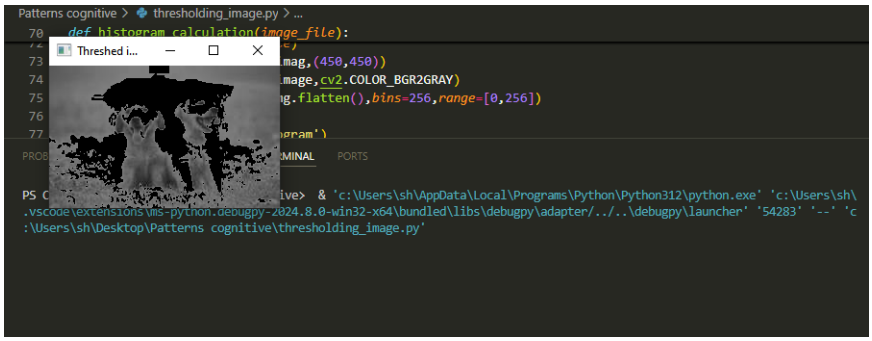
Thresholding an image using THRESH_TRUNC



Thresholding an image using THRESH_TOZERO

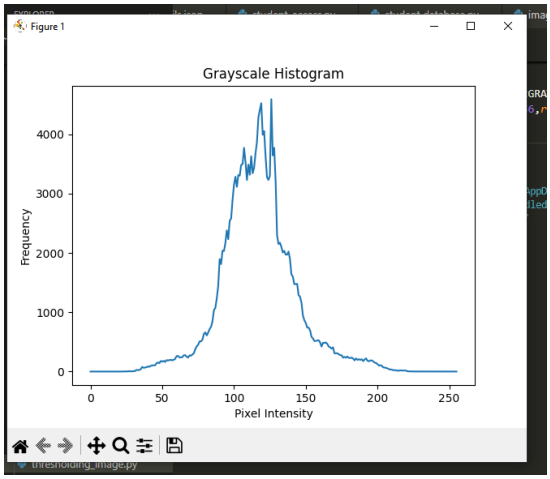


Thresholding an image using THRESH_TOZERO_INV

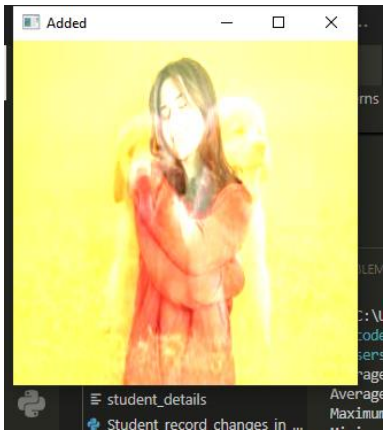


Intensity calculation of the image

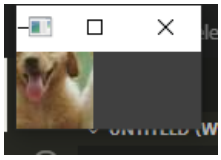
Histogram calculation of the image



Adding two images together



Cropping the image



Date:29/07/2024 **Day: Monday**

Task: Create a Python program using the cv2 and pytesseract modules to extract text from an image and allow the user to crop a specific word from the image. The program should read an image file, detect and display all text found in the image, and enable the user to input a word to search for. If the word is found, the program should crop the region containing the word, display the cropped image, and save it to disk. Ensure the program handles potential errors such as missing images or words not found in the text.

Program code:

```
import cv2
import pytesseract
from pytesseract import Output
import os
import matplotlib.pyplot as plt

pytesseract.pytesseract.tesseract_cmd = r'C:\Users\sh\Desktop\Patterns cognitive\Tesseract
python\tesseract.exe'

def show_text_from_image(image_path):
    # Read the image
    image = cv2.imread(image_path)
    if image is None:
        print(f"Error: Could not open or find the image {image_path}")
        return None, None

    # Convert the image to grayscale
    gray_image = cv2.cvtColor(image, cv2.COLOR_BGR2GRAY)

    # Use pytesseract to get data from the image
    data = pytesseract.image_to_data(gray_image, output_type=Output.DICT)

    # Print all detected text
    print("Detected text from the image:")
    for i in range(len(data['text'])):
        if int(data['conf'][i]) > 0:  # Confidence level filter to ignore low-confidence words
            print(data['text'][i], end=' ')
    print()  # Newline for better readability

    return image, data

def crop_word_from_image(image, data, word):
    # Iterate through all detected text
    for i in range(len(data['text'])):
        if word.lower() in data['text'][i].lower():
            x, y, w, h = data['left'][i], data['top'][i], data['width'][i], data['height'][i]
            cropped_image = image[y:y+h, x:x+w]

            # Display the cropped image
            plt.imshow(cv2.cvtColor(cropped_image, cv2.COLOR_BGR2RGB))
            plt.title(f'Cropped image containing: {word}')
            plt.axis('off')
            plt.show()

            # Save the cropped image
            cropped_image_path = f"cropped_{word}.png"
            cv2.imwrite(cropped_image_path, cropped_image)

            print(f"Cropped image saved as {cropped_image_path}")
            return

    print(f"Word '{word}' not found in the image.")

def main():
    image_path = input("Enter the path to the image: ")
    image, data = show_text_from_image(image_path)

    if image is not None and data is not None:
        word = input("Enter the word to search for: ")
        crop_word_from_image(image, data, word)
main()
```

Input and output:

```
Enter the path to the image: poem.jpeg
Detected text from the image:
Slow Down Is it strange to long for slow days filled with quiet moments of joy. The world seems to be in a rush, but I choos
e to remain still. ~a.b. MADE BY POEMSBYA ON ETSY Ce my
Enter the word to search for: moments
```

Date:30/07/2024 and 31/07/2024
Day:Tuesday and Wednesday

Task: Develop a Python program to store and retrieve images in a MySQL database. The program should convert an image file to binary data and insert it into a BLOB column in a MySQL table. After inserting the image, it should also include functionality to fetch the image from the database, save it to a file, and open the image for viewing.

Program code:

```python
import mysql.connector

def convert_to_binary_data(filename):
    # Convert digital data to binary format
    with open(filename, 'rb') as file:
        binary_data = file.read()
    return binary_data

def insert_image(name, photo):
    try:
        connection = mysql.connector.connect(
            host="localhost",
            username="root",
            password="Sairam2003!123",
            database="saveimage"
        )

        cursor = connection.cursor()
        sql_insert_blob_query = """ INSERT INTO images (name, data) VALUES (%s,%s)"""

        binary_data = convert_to_binary_data(photo)

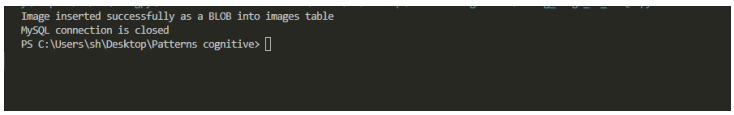
        # Convert data into tuple format
        insert_blob_tuple = (name, binary_data)
        result = cursor.execute(sql_insert_blob_query, insert_blob_tuple)
        connection.commit()
        print("Image inserted successfully as a BLOB into images table")

    except mysql.connector.Error as error:
        print("Failed inserting BLOB data into MySQL table {}".format(error))

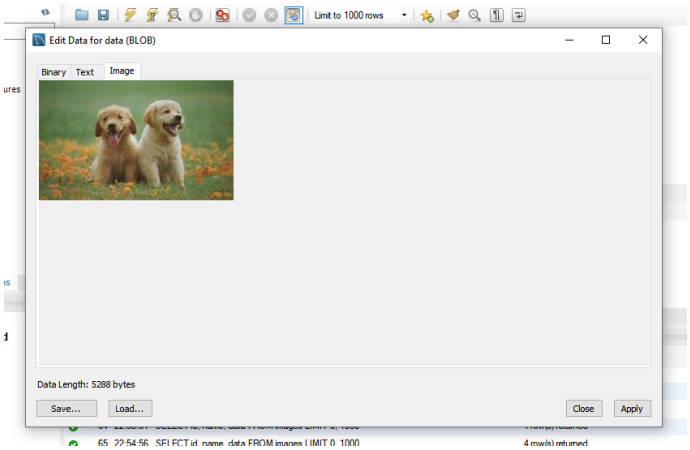
    finally:
        if connection.is_connected():
            cursor.close()
            connection.close()
            print("MySQL connection is closed")

insert_image("dogs.jpeg", "Dogs.jpeg")
```

Input and output:



Query to display the image from MYSQL :



Limit to 1000 rows
Edit Data for data (BLOB)
Binary
Text
Image
Data Length: 5288 bytes
